

The Studio Version 2022.12.12 Update included a **Visual Studio Code (VSCode) Extension** to provide Compilation, Execution and Broadcast functionality for AGK Studio.

To get started, **Download VSCode** @ <https://code.visualstudio.com/>

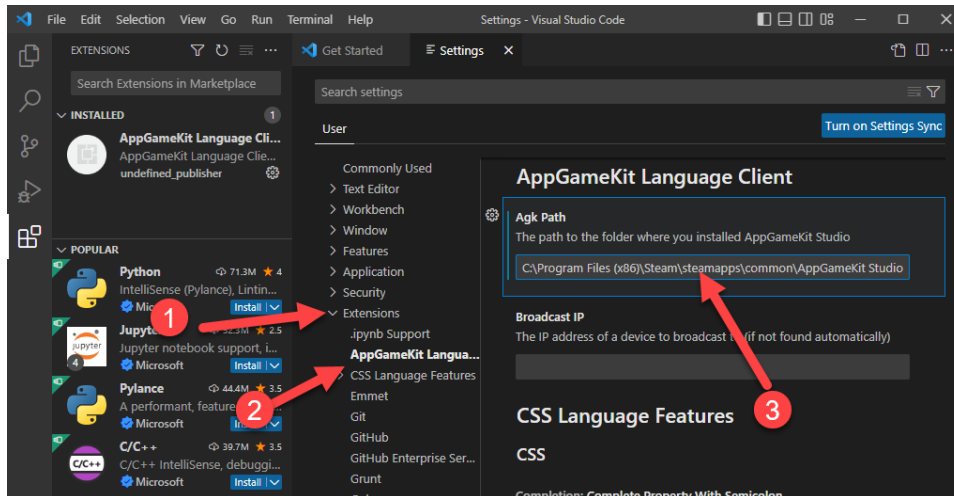

Install, Launch and select **Extensions**, then **View More Actions**, followed by **Install from VSIX**:

Once the extension is Installed, point it to your AGK Studio installation via Settings:

...then **Extensions** and set the **AGK Path** to your AGK Studio install location:

With the Set-up complete, you can open a Project by selecting **File/Open Folder** and navigating to your project's location.

Note the **Editor** pane containing **main.agc** (unless there are multiple .agc files in your project), the **Explorer** pane containing all of your project's **Files**, and the **Outline** pane containing all of the selected .agc **Variables** and **Functions** for quick navigation.
